## 20 10505     16 Fema~           7             9     10     9       6
## # ... with 5 more variables: WantsChildren <dbl>, Romantic <dbl>,
## #   AttractiveAppearance <dbl>, Creativity <dbl>, Honest <dbl>
```

Plotting 'humour' variable in a histogram :

```
humour_hist <- ggplot(ha_tib, aes(Humour))
humour_hist +
  geom_histogram(binwidth = 1, color = 'black', fill = 'dark green', alpha = 0.7) +
  labs(y = "Frequency", x = "Importance of humour (1-10)")
```

Customizing x scale : At the moment the x-axis is scaled from 5 to 10. Let's show the full range of the scale. To do this we need to set the limits of the x-axis using the `coord_cartesian()` function:

```
coord_cartesian(xlim = c(begin, end), ylim = c(begin, end))
```

You set the limits of the x-axis using `xlim` and the limits of the y-axis with `ylim`. After each you specify numbers representing the start and end values for the axis. You need to collect these values into a single object by enclosing them in `c()`.

```
humour_hist <- ggplot(ha_tib, aes(Humour))
humour_hist +
  geom_histogram(binwidth = 1, color = 'black', fill = 'dark green', alpha = 0.7) +
  labs(y = "Frequency", x = "Importance of humour (1-10)") +
  coord_cartesian(xlim = c(1, 10))
```

Overriding the default breaks and specifying the breaks for x-axis. Last line applies a theme to change the look. Other themes include `theme_classic`, `theme_bw`, `theme_dark`.

```
humour_hist <- ggplot(ha_tib, aes(Humour))
humour_hist +
  geom_histogram(binwidth = 1, color = 'black', fill = 'dark green', alpha = 0.7) +
  labs(y = "Frequency", x = "Importance of humour (1-10)") +
  coord_cartesian(xlim = c(1, 10)) +
  scale_x_continuous(breaks = 1:10) +
  theme_minimal()
```

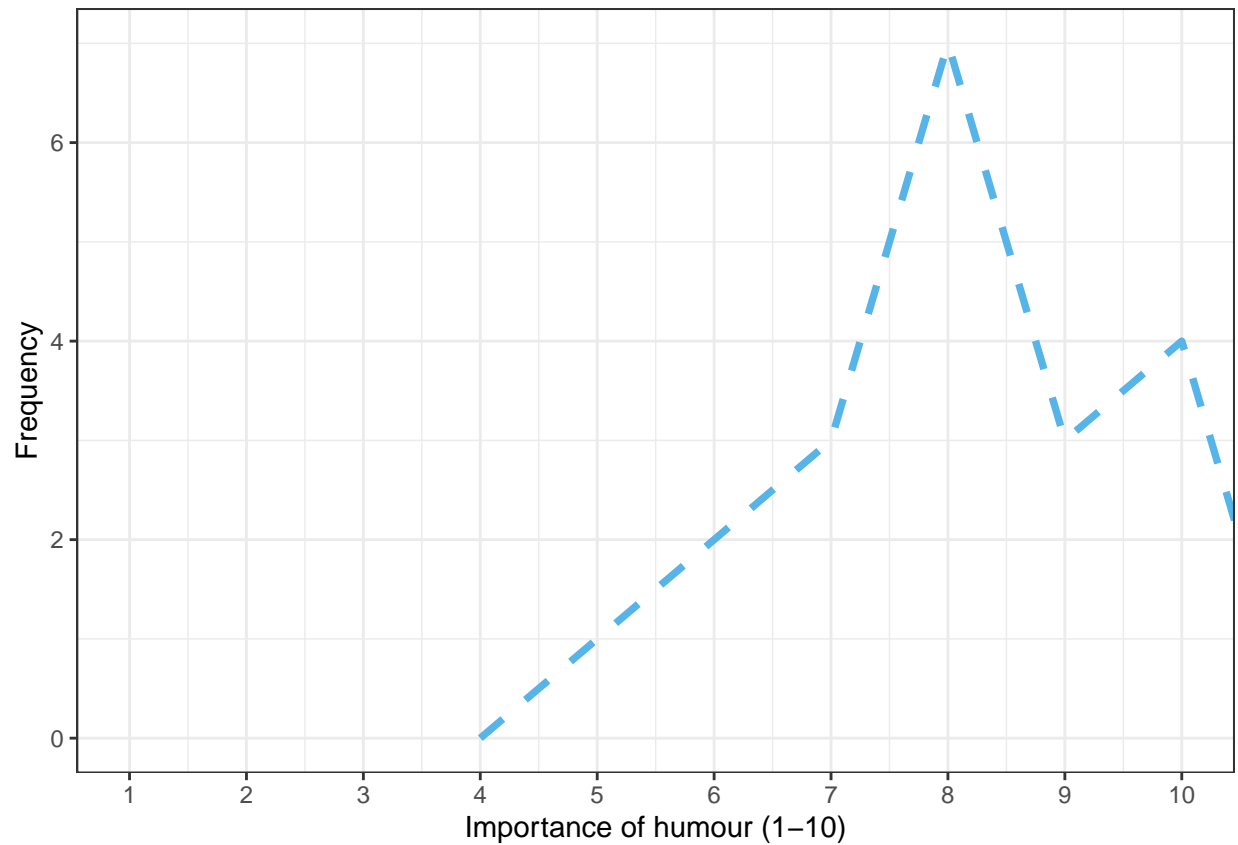

Drawing the same above graph as a frequency polygon. You can change the line size by adding “size” arg to `geom_freqpoly()`:

```
humour_poly <- ggplot2::ggplot(ha_tib, aes(Humour))
humour_poly +
  geom_freqpoly(binwidth = 1, colour = "#56B4E9", size = 1.5) +
  labs(y = "Frequency", x = "Importance of humour (1-10)") +
  coord_cartesian(xlim = c(1, 10)) +
  scale_x_continuous(breaks = 1:10) +
  theme_bw()
```

We can change the style of the line by including the `linetype =` option in the `geom_freqpoly()` function. Line types can either be defined using numbers (0 = blank, 1 = solid (default), 2 = dashed, 3 = dotted, 4 = dotdash, 5 = longdash, 6 = twodash) or as text (“blank”, “solid”, “dashed”, “dotted”, “dotdash”, “longdash”, or “twodash”).

```
humour_poly <- ggplot2::ggplot(ha_tib, aes(Humour))
humour_poly +
  geom_freqpoly(binwidth = 1, colour = "#56B4E9", size = 1.3, linetype = 'dashed') +
  labs(y = "Frequency", x = "Importance of humour (1-10)") +
  coord_cartesian(xlim = c(1, 10)) +
  scale_x_continuous(breaks = 1:10) +
  theme_bw()
```

You can draw more than one plot in one diagram, but R will process the plots in the order they are executed:

```
humour_poly <- ggplot2::ggplot(ha_tib, aes(Humour))

humour_poly +
  geom_histogram(binwidth = 1, color = 'black', fill = 'dark green', alpha = 0.7) +
  geom_freqpoly(binwidth = 1, colour = "#56B4E9", size = 1.3, linetype = 'dashed') +
  labs(y = "Frequency", x = "Importance of humour (1-10)") +
  coord_cartesian(xlim = c(1, 10)) +
  scale_x_continuous(breaks = 1:10) +
  theme_bw()
```
